//oce-"Vector: pBluescript SK(-); Site_1: EcoRI; Site_2:
XhoI; Tissue supplied by Christian Bachem and Richard
Visser (Department of Plant Breeding, Wageningen
University, The Netherlands). The ecory, Wageningen
University, The Netherlands). The cSTA libraries will
attempt to capture the induction and initiation/initial
growth of the tuber in an in vitro system as described in
Bachem et al. (Plant Journal, 1996). Small microtubers
develop from axillary buds attached to stem explants when
placed on a high sucrose medium (10%). Visible
morphological changes occur synchronously at day five in
the axillary buds. The first library, cSTA (1-20) consists
of axillary buds harvested on days 1-3. This targets
those genes involved in induction of the microtubers. The
capture genes involved in induction of the microtubers.
This libraries, cSTA (21-40) and cSTA (41-60),
capture genes involved in tuber initiation and outgrowth.
This library is noted as p3 in Tanksley lab notebooks."

/note="Vector: pBluescript SK(-); Site_1: EcoRI; Site_2: XhoI; This library targets genes expressed in dormant tubers. This library was made from sections of dormant tuber, avoiding the buds and epidermis. Tuber were stored for one month post-harvest at 4oC. The tuber was peeled, well away from the surface. Then it was chopped into 1-2 mm cubes and immediately frozen in liquid nitrogen. This library is noted as P4 in Tanksley lab notebooks."

Embryos were cut from mature, dormant seeds and imbibed in
25 microw ABA (abscisic acid) in 5 mW Mes buffer, pH 5.7,
for 12 hr at 22 C. The tissue, total RNA, and poly(A)
RNA were prepared by Steven Verhey in M.K.
Walker-Simmons's lab (USDA-ARS, Washington State Univ.,
Walker-Simmons's lab (USDA-ARS, Washington State Univ.,
Pullman, Washington 99164-6420 A cDNA library was made
by Clontech using a combination of random and oligo dr
primers. Library was plated and archived by Russell
Johnson (Colby College, ME/Walker-Simmons' lab).
DNA preparations and DNA sequencing were performed in the
OD Anderson lab (all other authors)."

//note="vector: pBluescript II SK+; Site_I: EcoRI; Site_2:
Xhoi; The cDNA library was constructed from mRNA isolated
from mature flowers of field grown plants for the cultivar
Raiden: Complementary DNA was synthesized from mRNA using
a primer consisting of a poly(dT) sequence with a XhoI
restriction site. EcoRI adapters were ligated to the
blunt-ended cDNA fragments followed by Xhoi digestion. The
cDNA fragments were directionally cloned into the
EcoRI-XhoI restriction site of the pBluescript vector. The
ligated cDNA fragments were transformed into DH10B host
cells (GibcoBRL). This library was constructed in the
laboratory of Dr. Randy Shoemaker.

/note="Vector: pBluescript II SK+; Site_1: Ecok1; Site_2: Xho1; The CDNA library was constructed from mRNA isolated from mature seed pods of greenhouse grown plants prior to senescence for the cultivar KP1. Complementary DNA was synthesized from mRNA using a primer consisting of a poly(dT) sequence with a XhoI restriction site. EcokI adapters were ligated to the blunt-ended cDNA fragments followed by XhoI digestion. The CDNA fragments directionally cloned into the EcokI.*XhoI restriction site of the pBluescript vector. The ligated cDNA fragments were transformed into DH10B host cells (GibcoBRL). This library was constructed in the laboratory of Dr. Randy Shoemaker.
                                                                                                                                                                                                                                                                                                                                        This clone is available through: ResGen, Invitrogen Corp. 2130 South Memorial Parkway Huntsville, AL 35801 For further information call: (800)-533-4363 or contact via email: ccu@resgen.com High quality sequence stop: 415.

The nucleic acid sequences of the invention may be used for recombinant production of the encoded proteins, which are then used to rease antibodies (Ab) for identifying plants with deficient or defective production of the protein. They may also be used to detect such plants by hybridization and to should be sequences from other plants by hybridization and to sense constructs for reducing/deleting GRTI protein activity in plants. These transgenic plants may be used to produce glycoproteins with minimal, uniform and defined sugar residues. Such glycoproteins with useful in medicine and research, e.g. human glucocerebrosidase for treating Gaucher's disease. Plants which are defective or deficient in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       production of the GnTI protein can be made to produce glycoproteins with minimal, uniform and defined sugar residues, of low antigenicity. Use of these plants eliminates the need for the difficult isolation and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      deglycoslyation of native proteins or preparation in defective animal cells. This sequence represents potato (Solanum tuberosum) GnTI encoding

This invention describes novel plant N-acetylglucosaminyl transferase I (GnTI) proteins and their encoding nucleic acids. The nucleic acid sequences of the invention may be used for recombinant production of the encoded proteins, which are then used to raise antibodies (Ab) for identifying plants with deficient or defective production of the protein. They may also be used to detect such plants by hybridization and to solate related sequences from other plants or to generate antisense or sense constructs for reducing/deleting GnTI protein activity in plants. These transperic plants may be used to produce glycoproteins with minimal, uniform and defined sugar residues. Such glycoproteins are useful in medicine and research, e.g. human glucocerebrosidase for treating Gaucher's disease. Plants which are defective or deficient in production of the GnTI protein can be made to produce glycoproteins with minimal, uniform and defined sugar residues, of low antigenicity. Use of these plants eliminates the need for the difficult isolation and deglycoslyation of native proteins or preparation in defective animal deglycoslyation of native proteins or preparation in defective animal constructions.
                                                                                                                                                                                                     104

```
AAQ62625 encodes a rat N-acetyl-glucosamine transferase (see AAR52657). The enzyme can be used when glycoproteins are produced in yeast so that the natural sugar chain type can be added to the protein of interest, ie. instead of the mannose residues that yeast normally
